What would you say is the best method to profile a core if you don't have access to a pre-profiled one and you have to make it from scratch?

My method was:

1. Had the wood core at the correct max thickness I wanted.
2. You know that as you move from the middle of the core to the tips it starts to get thinner. A Belt Sander does amazing work. I suggest using one of these with a rough grit and just keep moving back and fourth taking little bites and making sure youre keeping your core level as you decrease in thickness. I gauged my thickness by already having my side walls glued to my core so I was able to follow that.

I hope this helps.

Austin
